

on the frame for rotation in a common plane, the method comprising:

attaching at least one counter-rotatable braking device to the frame, the device comprising means to allow rotation of the device in one direction and to resist rotation in the other direction, and

mounting at least one braking wheel to the frame forward of the skating wheels to allow displacement of the axis of the braking wheel in a direction approximately in line with the axis of the braking device and to allow the braking wheel to contact the braking device, such that when both the front skating wheel and the braking wheel are in contact with the skating surface, the contact point between the braking wheel and the braking device is approximately vertically above the contact point between the braking wheel and the skating surface.

Another version of the replacement claims marked up to show all changes is provided in the attached amendment paper (wherein omitted material is shown in brackets and added material is underlined).

In the Specification

Please amend paragraph 11 of the specification as shown below:

11. Broadly, in another aspect, the present invention concerns an in-line roller skate for skating on a skating surface comprising a boot for supporting the foot of a user, a frame secured to the boot having a pair of parallel elongated slots in the
